SUMMER HONEY WHITE (WIT)

OG:1.050

IBU: 17.3

ABV: 4.9%

Ingredients:

- 1 (3.3 lbs.) Wheat unhopped malt extract
- 1 lb Light dried malt extract
- 1 lb orange blossom honey
- 1 lb White wheat malt
- .5 lb munich malt
- .5 lb carapils malt
- 1 oz. Tettnang hop pellets
- 1 oz. Hallertaur hop pellets
- 1 oz. Crushed Coriander seed
- 1 oz. Bitter Orange peel
- 1 tsp. Irish Moss
- White Labs Belgian Wit yeast or 1 pkg. Nottingham dry yeast
- 1 1/4 cups dry malt extract for priming or 3/4 cup priming sugar

Directions:

1. Steep grains, crushed coriander and bitter orange peel in a hop bag in 1.5 gallons of water at 155° for 45-60 minutes. Remove grains and spices and bring to boil.
2. Remove from heat and add malt extract and stirring until completely dissolved.
3. Return to boil and add 1oz Tettnang hops. Boil for 35 minutes.
4. Add Irish Moss and continue boiling for 5 minutes.
5. Add Honey and 1 oz Hallertaur hops and turn off heat.
6. Combine wort with water to make five gallons. There is no need to strain.
7. Pitch yeast when wort temperature is between 70-80°.
8. If using one-step fermentation, allow it to sit in the fermentation vessel at 68-72° for about seven days, then use a sanitized hydrometer to ensure that the beer has reached its final gravity. If using two-step fermentation, rack to a secondary fermentation vessel (glass carboy) after 5 days and allow it to sit for another 10-14 days before bottling.
9. Prime and bottle. When priming, dissolve corn sugar or dry malt extract in two pints of boiling water for 5 minutes. Pour this mixture into the empty bottling bucket and siphon the beer from the fermenter over it. This method ensures that the priming sugar will disperse evenly through your beer.
10. For proper carbonation, store your beer at 75° for at least the first week after bottling. This will allow the yeast to feed on the priming sugar and produce the necessary carbon dioxide needed for carbonation. It's ready to drink, but it will improve if you age your beer another two to three weeks.
